

# ASSEMBLY/DISASSEMBLY

(Your saddle Hautacam is already assembled when you receive it)

## Proust saddle exploded view

### ① Insert platinum in seat post :

With an allen key, unscrew the stop screw, this allows insert platinum.

- Insert platinum as picture (the stop screw has to enter in the oblong hole).
- Screw the stop screw until it is completely in the seat post. This screw enter in the platinum oblong hole.
- You can adjust harder of pivot, tightening less or more the screw brake.

### ② Fixing shell on the platinum :

- Unscrew the screw under platinum without disassemble all parts of it.

- Insert the shell and screw.

**Adjustment of the shell :** you can advance, back or tilt the shell. Ideally, the shell must be assembled back as much as possible, and inclined (5 degrees minimum).

## Seat in the Proust Saddle

(Hautacam Universal DP 2.2 and Perthus Absolute Comfort DP 1.2)

### **General principles :**

- In any position on the handlebar and climbing a hill, there is no contact with genital part or perineum. Hands on the handlebar you have to feel good on the Proust Saddle.
- Saddle follows the natural movement of the pelvis and so, pivots.
- The pivot must be as free as possible, with a sweet movement.

### **Saddle height adjusting (picture 1) :**

- Setting on the saddle, on ischia (= pelvis bones), hands on the handlebar, with the more usual position.
- In socks, put heel on the pedal (the more down). The leg has to be stretch and heel brushing against pedal.
- This is a setting basic. You have to setting according to you, your thickness shoe.

Picture 1

### • **If «slipping» in advance** (too extended position) :

- Raise handlebar or
- Shorten the stem (sometime you can turn over it)

### • **If ischia ache** (overheating because of rubbing) :

- Lower the saddle.
- See pantie or short seam.
- Change inclination.

### • **If ischia ache for only one ischia** (leg more short or different ossification) :

- Put saddle to the height leg more short.
- Change saddle inclination for different ossification.
- If the problem persists, put a slipcover Proust Saddle, or bandage like «Compeed», or choose Dolomite Universal DP 3.2.

### **Maintenance :**

When pivoting begins to «paste», to be hard, to make noise (creaking) : disassemble platinum, unscrew the stop screw. Clean up old grease on axis, in the seat post and parts in contact, with grease remover. Put a bit new grease and assemble.

**!! Don't carry your bike by the saddle. You spoil your longevity saddle.**
